In this comprehensive guide, we'll cover everything you need to know to build your own Ruby on Rails website, from setting up your development environment to deploying your application. We'll start with the basics, and then we'll gradually move on to more advanced topics.

Chapter 1: Setting Up Your Development Environment

In this chapter, we'll cover the basics of setting up your Ruby on Rails development environment. We'll start by installing the necessary software, and then we'll create a new Rails application.

Installing the Necessary Software

The first step is to install the necessary software. You'll need the following:

- Ruby
- Rails
- A text editor or IDE

You can find detailed instructions on how to install these on the Ruby on Rails website.

Creating a New Rails Application

Once you have the necessary software installed, you can create a new Rails application. To do this, open your terminal and type the following command:

```
my_app
```

This will create a new migration file. A migration is a file that describes changes to your database. To run the migration, type the following command:

```
posts
```

- `app/views/posts/index.html.erb` :

```
app/views/posts/new.html.erb
```

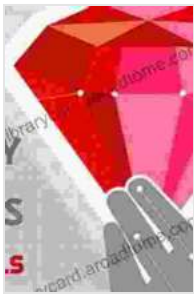

- `app/views/posts/edit.html.erb` :

```
app/views/posts/show.html.erb
```

Running the Application

To run the application, open your terminal and type the following command:

```
rails s
```
