A screenshot of an IDE window showing Java code. The code defines a class with a constructor and a read() method. The constructor initializes a socket, sets a timeout, and creates a BufferedReader. The read() method reads data from the socket and prints it to the console. The code is as follows:

```
import java.io.*;
import java.net.*;

public class Client {
    private Socket socket;
    private BufferedReader reader;

    public Client(String host, int port) throws IOException {
        socket = new Socket(host, port);
        socket.setSoTimeout(1000);
        reader = new BufferedReader(new InputStreamReader(socket.getInputStream()));
    }

    public String read() throws IOException {
        String line;
        while ((line = reader.readLine()) != null) {
            System.out.println(line);
        }
    }

    public static void main(String[] args) throws IOException {
        Client client = new Client("localhost", 8080);
        client.read();
    }
}
```

Chapter 4: Testing and Debugging

- Mastering testing techniques to ensure app reliability and stability
- Debugging common errors and identifying performance bottlenecks
- Implementing robust error handling mechanisms to enhance user experience
