## History

The field study site was established in 1965 by the University of California, Berkeley. The site was originally used for research on the ecology of the California Coast Range. In the years since its establishment, the site has been used for a wide variety of research projects, including studies on the effects of climate change, the impacts of invasive species, and the restoration of native ecosystems.

## **Geology**

The field study site is located in the California Coast Range. The site is underlain by a variety of rock types, including sandstone, shale, and limestone. The site is also home to a number of faults, which have created a complex and diverse landscape.

## **Climate**

The field study site has a Mediterranean climate, with warm, dry summers and cool, wet winters. The average annual temperature is 55 degrees Fahrenheit. The average annual precipitation is 25 inches.

## **Vegetation**

The field study site is home to a variety of vegetation types, including grasslands, woodlands, and forests. The site is also home to a number of rare and endangered plant species.

## **Wildlife**

The field study site is home to a variety of wildlife, including deer, elk, bears, and mountain lions. The site is also home to a number of migratory birds.

The field study site is a unique and valuable natural area that provides opportunities for research, education, and recreation. This book provides a comprehensive overview of the site, including its history, geology, climate, vegetation, and wildlife. It is an essential resource for anyone interested in the site's ecology or natural history.
